                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       anticoxidant properties and in addition some flavonoids exhibit antitumoural properties. They also exhibit a role in plant protection against parthogenic agents and UV light irradiation. Manipulation of the TDET1 gene expression can also be used to modify anthocyanin and carotenoid content in ornamental species for the achievement of new colour variants. Alteration of carotenoid content is useful for improving resistance to Norflurazon herbicides. Further it is possible to combine a modified TDET1 activity with mutations such as rin, nor and Nr, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a tomato TDET1 (HP-2) gene, which if modified, result in a light hypersensitive phenotype. The gene, wen altered, is responsible for the light hypersensitive mutant phenotype in Solanum lycopersicum (tomato) plants, the phenotype comprising a reduced growth of the plant associated with high levels of carotenoids and/or chlorophylls and/or little some comprising the sequence gene can be used to produce transgenic plants, such as pepper, eggplant, soybean, grape, melon, rice, carrot, spinach, citrus, pomaceae or ornamental species, that contain a tomato TDETI gene. The TDETI mutants are useful in the agro-industrial sector, for generating tomato fruits with high carotenoid and/or flavonoid contents. Carotenoids and flavonoids have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tomato, TDET1 (HP-2) gene; light hypersensitive phenotype; mutation; carotenoid; chlorophyll; flavonoid; transgenic; TDET1 gene; anthocyanin; agro-industrial; antioxidant; antitumoural; plant protection; variant; ornamental; herbicide; fruit ripening; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleotide sequences of the tomato TDET1 (HP-2) gene, which if modified,

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearoyl-CoA desaturase) gene genes in interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA: kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have ancrectic, antidiabetic, antiatreriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target studying gene function and validation; genetic empinesting; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is
                                                                                                                                                                                                                                                                  short interfering nucleic acid; siNA; downregulation; inhibition; SCD; stearcyl-CoA desaturase; RNA interference; anorectic; antidiabetic; antiatreiosclerotic; cytostatic; virucide; obesity; diabetes; atherosclerosis; cancer; viral infection; drug screening; genetic engineering; pharmacogenomic; gene mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity or diabetes, downregulates expression of the stearoyl-CoA desaturase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 15.4; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearoyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antidiates and antidiate expression of SCD inhibiting virucide activities. The siNAs can be used to modulate expression of SCD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     obesity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 genes, in cells, tissue explants or organisms, e.g. for treating obesity diabeters (types I and II); atherosolerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD sina, which is used in the exemplification of the present invention.

The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      당
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gene function studies and gene mapping. The current sequence is that the human BCR-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention describes the use of a nucleic acid (I), of at least 8 nucleotides (nt), and (essentially) identical with nucleic acid (II) present at specified positions in chromosomes 5 or 11 of pigs (or homologous positions in other animals) for determining predisposition for expression or inheritance of the 'splay-leg' phenotype in mammals and poultry. The specified positions are regions of microsatellite markers (a) for chromosome 5, 84426, 8425, 84995, IGF1, 80005, 84933, 841987, 80108, 84325, 84995, IGF1, 80005, 84983, 841987, 80108, 8435, 801094, 8496, Also described are: an in vitro method for determining the predisposition for expression or inheritance of the 'splay-leg' phenotype in mammals, their (un)fertilized eggs or sperm by detectining presence, condition or expression of (II); and a kit comprising primer pair for amplification of (II); and a kit comprising primer pair for amplification of (II); in one or more containers. The method is used for actual binds to (II), in one or more containers. The method is used for eatle, dogs, pigs, chickens etc.) that lack predisposition to the phenotype, particularly as a genomic screen applied to many mammals in a population. This sequence represents a primer that can be used to be account of the 'splay-leg' determine predisposition for expression or inheritance of the 'splay-leg'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       splay-leg phenotype; microsatellite marker; Sw1468; Sw2; Sw1200; Sw2425; Sw995; IGP1; S0005; Sw963; Sw1987; S0018; Sw904; Sw310; Swr1974; Swr426; Sw1094; Sw986; Sw1982; S0182; S0071; Sw2008; Sw435; S0009; S0230; Sw486; selective breeding; ss; primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-vabl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siNNA of the invention demonstrates cycostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human BCR-targeted siNNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         splay-leg phenotype; microsatellite marker; Sw1468; Sw2; Sw1200; Sw2425;

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (RGP) receptor 3 (also known as FGR-3) ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGRR-3 such as developmental disorders or hyperporliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, brast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                    /*tag= a //mod base= OTHER //mod base= OTHER //mod base= OTHER //mode are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel compound targeted to a nucleic acid molecule encoding fibroblast growth factor receptor 3, useful for inhibiting the expression of the receptor and for treating an animal having cancer or developmental

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes the use of a nucleic acid (I), of at least 8

nucleotides (nt), and (essentially) identical with nucleic acid (II)

present at specified positions in chromosomes 5 or 11 of pigs (or
homologous positions in other animals) for determining predisposition for
expression or inheritance of the 'splay-leg' phenotype in mammals and
poultry. The specified positions are regions of microsacellite markers
(a) for chromosome 5, 8w168, 8w2, 8w1200, 8w425, 8w995, IGT, 80005,

Sw963, Diddention or expression or inheritance. The method is used
for selection of animals (domestic, breeding or farm animals, e.g.
cattle, dogs, pigs, chickens etc.) that lack predisposition to the
population. This sequence represents a primer that can be used to
cheternine predisposition for expression or inheritance of the 'splay-leg'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; antisense; fibroblast growth factor receptor 3; prophylaxis; developmental disorder; hyperproliferative disorder; antisense therapy; FGFR-3; ACH; JTK4; CEK2; cancer; phosphorothioate; ss.

Rat protein phosphatase 2 oligo inhibitor SEQ ID No 110.

Homo sapiens.

dß.

```
The invention relates to a novel compound 8-50 nuclectides in length targeted to a nucleic acid molecule encoding a protein phosphatase 2 catalytic beta subunit, where the compound specifically hybridises with and inhibits the expression of protein phosphatase 2 catalytic beta subunits, or specifically hybridises with at least an 8-nucleotide subunits, or specifically hybridises with at least an 8-nucleotide consorted or a nucleic acid molecule encoding a protein phosphatase 2 catalytic beta subunit. The antisense compounds are useful for modulating the expression of protein phosphatase 2 catalytic beta subunits and for treating diseases or conditions associated with expression of protein phosphatase 2 catalytic beta subunits, e.g. or parent insulin regulation or diabetes or a hyperproliferative disorder, particularly cancer. The antisense compounds are also useful for diagnostics, therapoutics, prophylaxis, e.g. to prevent or delay inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. This polynuclectide sequence represents an oligonucleotide inhibitor of tat protein phosphatase 2 catalytic beta subunit mRNA levels of the invention. NOTE: This oligonucleotide contains phosphorothioate residues and has 2'- MOE wings with a deoxy gap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides targeted to nucleic acid encoding Protein Phosphatase 2 catalytic subunit beta, useful for treating diseases related to Protein Phosphatase 2 catalytic subunit beta expression, such

Human oligonucleotide sequence. ABZ91730 standard; DNA; 20 BP. 17-OCT-2003 (first entry) ABZ91730; RESULT 1210 ABZ91730

Human, antisense; lung dysfunction, nasal airway dysfunction, antinflammatory steroid; ubiquinone; antinflammatory; antiallergic; antiathmatic; properative; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5, or 3, end genomic flanking regions, 5, and 3, intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of antiinflammatory steroid in a subject, for reducing levels of antiinflammatory steroid in a subject, for reducing levels of cepetor, producing bronchodilation, increasing levels of darnone or lung surfactant in a subject, stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Under The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                              Aguilar D;

This probe, from construct M13-mp18, is from 162-181 base of the sequence represented in AAQ05931, which is the presumptive hemolysin gene of L. monocytogenes. The probe is used for detection and enumeration of L. monocytogenes, esp. for detection in dairy prods. such as milk and cheese by colony hybridisation assays. See also AAQ05898-900 and AAQ05930-31. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with orgoing US granted patent numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiashmatic, an algesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or maligant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, allergies and/or bronchoconstriction and a sesociated inflammation, allergies and/or surfactant hypoproduction are associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thy midines present in the target RNA serves to prevent the braskdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and

                                                                                                                                                                                                                                               ઠે
                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                        Oligos LOI, LO2, LO3 and LO4 are used for the amplification of hly (alpha -haemolysin) virulence factor; and oligos AD07, AD08 and AD09 are used for the amplification of iap (beta-haemolysin) virulence factor. They are used in a detection method for Listeria monocytogenes in food samples which is faster and more sensitive than the classical bacteriological methods. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                Listeria monocytogenes detection by enzymatic nucleic acid amplification - using oligo-nucleotide(s) derived from alpha-haemolysin and/or beta-haemolysin virulence factors in polymerase chain reactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Quantitative PCR analysis was performed using primers (AAT31580-81) to

The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for
amplify mouse Ich-1, primers (AAT31582-83) to amplify human Ich-1, primers (AAT31584-85) to amplify human interleukin-1 beta converting enzyme (HICE), and control primers (AAT31586-87) for mouse beta-actin. Ich-1 is a new member of the ICE/ced-3 family of cell death genes. Ich-11 (See also AAT31552) and Ich-15 (AAT31553) were amplified simulateneously to produce DNA fragments of 234 and 295 bp, respectively. Expression of Ich-18 was detected in HeLa and Jurkat cells but not in THP I or U937
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                        cells. Expression levels of Ich-1L increased in dying hybridoma DO11.10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection; polymorphism; perfect compound simple sequence repeat; adaptor directed primer; genome; genetic; fingerprinting; amplified fragment length polymorphism assay; microsatellite region; genetic trait marking; germplasm comparisons; compound; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

This 20-mer oligonucleotide primer is used in a novel method of amplifying a nucleic acid molecule involving ribonucleotide tailing of single stranded DNA in the presence of terminal transferase. This method can be used for sequencing RNA, especially the 5'-end and involves a 3' tail of 2 to 4 ribonucleotides being attached onto the target sequence with high efficiency. The first step in cloning and sequencing the unknown 5'-end of a specific mRNA molecule involves the synthesis of single stranded cDNA using a primer specific for a known region in the 3' region of the mRNA. A tail of two rGTPP's is attached to the mRNA using transferase and a specific double stranded DNA adapter is attached via a complementary 3' overhang (i.e. CC) in the presence of T4 crainal transferase and a specific double stranded DNA adapter specific primer and a complementary 3' overhang (i.e. CC) in the presence of T4 crain and a complementary as including a desired restriction site produces a unique PCR product suitable for direct solid-phase stranded of the control of the produces a unique PCR product suitable for direct solid-phase stranded of the control of the produces a unique PCR product suitable for direct solid-phase stranded of the produces a unique PCR product suitable for direct solid-phase stranded of the produces a unique PCR product suitable for direct solid-phase

The protein can be used in the investigation, diagnosis and treatment (including gene therapy) of diseases in which abnormal neovascularisation takes place, such as solid tumour proliferation, metastasis, chronic rheumatoid architis, psoriasis and retinopathy (including diabetic retinopathy and retinopathy of
                                                                                        KDR signal transduction inducer protein; human; diabetic retinopathy; vascular endothelial cell growth receptor; abnormal neovascularisation; kinase insert domain-containing receptor; solid tumour proliferation; gene therapy; metastasis; chronic rheumatoid arthritis; psoriasis; retinopathy of prematurity; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense, human Integrin beta 4 binding protein; hIbeta4BP; cytostatic; cell proliferation; cancer; gene therapy; phosphorothioate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                            Primer for KDR signal transduction inducer protein coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              prematurity). It may be used as a screen for candidate KDR signal transduction inhibitors for therapeutic use

The present invention relates to a method for detecting early stage allergic diseases, particularly atopic dermatitis. The method comprises determining the expression levels of granulocyte macrophage colony stimulating factor receptor alpha or beta (GW-CSF R-alpha or -beta), interleukin 3 receptor alpha or beta (GW-CSF R-alpha or -beta). Literleukin 3 receptor Appa (IL-3 R-alpha), bc1-2, bc1-x, platelet activation factor receptor (PAF R) or CD44 in eosinocytes of a subject to be tested. The method further comprises comparison with expression levels in healthy volunteers. The method is useful for the early diagnosis and treatment of early stage allergic diseases such as atopic dermatitis. The present sequence represents a PCR primer used in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting early stage allergic diseases with markers of 7 genes of GM-CSF R-beta, GM-CSF R-alpha, IL-3 R-alpha, PAF R, bcl-2, bcl-x and CD44 in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound targeted to a region of a nucleic acid encoding human Integrin beta 4 binding protein and that inhibits expression of the nucleic acid, for treating e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to antisense compounds targetted to a nucleic acid encoding human. Integrin beta 4 binding protein (Nibeta4BP), which specifically hybridises with the nucleic acid and inhibits its expression. The antisense compounds are useful to prevent or treat diseases associated with Nibeta4BP expression, particularly conditions tinvolving aberrant or deregulated call proliferation (e.g. cancer). The hibeta4BP polynucleotide is used in gene therapy. The present sequence is an antisense oligonucleotide targetted to hibeta4BP

The invention relates to a nucleic acid encoding a adipose (ADP)

polypeptide which regulates, causes or contributes to obesity in an
animal or a human. The polyprucleotides, proteins, ant-adp antibodies,
modulators of adp activity, adp antisense nucleic acids, expression
vectors, adp transgenic animals are useful in the diagnosis and treatment
of obesity, adiposites, bulimia, wasting (cachexia), eating disorders
and/or disorders of body weight/body mass, weight loss due to cancer or
infectious diseases, genetic disorders associated with hypogonadism e.g.
Prader-Willi syndrome, Laurence-Moon-Biedl syndrome, hypothyroidism,
c diabetes, Cushing's syndrome, endocrine disorders, gastrointestinal
diseases, inflammatory bowel disease, ulcerative colitis, and anorexia
nervosa. They are also useful for treating disorders of body weight/mass
c e.g. glycogen storage diseases, and lipid storage diseases and for
treating lipomas, and/or liposarcomas. The compositions are also useful
for treating conditions associated with under weight e.g. enhancing or

```
The present invention describes novel human proteins designated NOVX (where X is 1, 2a, 2b, 2c, 2d, 3, 4, 5, 6a, 6b, 7, 8, or 9). NOV1 is a tyrosine kinese felike protein; NOV2a dare keratin 4-like proteins; NOV3 is a collagen-like protein; NOV4 is a cystatin B-like protein; NOV5 is a serotonin receptor-like protein; NOV6 and NOV55 v are cold inducible glycoprotein 30-like protein; NOV7 is a matrilin-like protein; NOV9 is a leukocyte surface antigen (CD53)-like protein; and NOV9 is a tyrosine kinase-like protein. NOV8 sequences have cytostatic, antiatteriosclerotic, cardiovascular; antidiabetic, immunosuppressive and neuroprotective activities, and can be used in gene therapy. The NOVX sequences can be used in therapeutics, particularly for treating, preventing or alleviating a NOVX-associated disorder include state in a subject, particularly a human. These disorders include cratdomyopathy, atherosclerosis, a disorder related to cell signal processing and metabolic pathway modulation or diabetes. The NOVX sequences are also useful for determining the presence of or predisposition to a disease associated with altered levels of NOVX sequences are nucleic acid, particularly cancer. The NOVX sequences are especially useful in therapeutic or prophylactic applications for neuropositic acid, particularly cancer. The NOVX sequences are especially useful in therapeutic or prophylactic applications for neuroposition to a disease associated with altered levels of NOVX respective respecially useful in therapeutic or prophylactic applications for neuropositions in the treatment of include neuropositions and

                         17-APR-2003
  The invention relates to a novel method for determining racing potential of a horse. The method comprises measuring: whether grandpaternal DNA is over-represented in the genome of the horse; or in the case where one of the grandmothers was selected for breeding on the basis of racing performance, whether grandmaternal DNA from the selected grandmother is over represented in the genome of the horse which indicates that the horse has good racing potential. The method of the invention is useful for determining the racing potential of a horse or for obtaining a progeny horse with good racing potential. This polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining the racing potential of a horse comprises measuring whether grandpaternal or grandmaternal DNA from the selected grandmother DNA is over-represented in the genome of the horse.
                                                                                                                                                                                                                Racing potential; horse; grandpaternal DNA; over-represented; breeding; grandmother; performance; progeny horse; PCR; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               represents a PCR primer used in the detection method of over-
representation of DNA from male grandparents of the invention

The polypeptide is useful for preparing a composition for treating or preventing e.g. cancer. This sequence represents a primer used to isolate DNA encoding a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hyaluronic acid, glycosaminoglycan, hyaluronan synthase, antirheumatic, UDP-glucose 6-dehydrogenase; UDP-glucose pyrophosphorylase; orthopaedic; UDP-N-acetylglucosamine, ophthalmological, dermatcological; joint surgery; eye; rheumatcology; dermatcology; adhesion; development; cell motility; cancer; angiogenesis; wound healing; ss; PCR; primer.

The invention relates to a novel method which comprises producing a hyaluronic acid via cultivating a Bacillus host cell under conditions suitable for production of the hyaluronic acid and subsequently recovering the production of the hyaluronic acid and subsequently recovering the hyaluronic acid from the cultivation medium. The most abundant heteropolysaccharides of the body are the glycosaminoglycans, of which hyaluronic acid is an example. A number of enzymes are involved in the biosynthesis of hyaluronic acid including hyaluronan synthase, UDP-glucose f-dehydrogenase, UDP-glucose pyrophosphorylase and UDP-northy acetylglucosamine. The molecules of the invention demonstrate ophthalmalogical, antirhenmatic and dermatological activities, whilst the method itself may be useful for producing a hyaluronan in a recombinant host cell. The hyaluronan generated may be used in eye and joint surgery, corthopaedics, rheumatology or dermatology and may exhibit further uses within the fields of adhesion, development, cell motility, cancer, angiogenesis and wound healing. The current sequence is that of the PCR primer of the invention which was used during analysis of the enzymes
Producing a hyaluronic acid (e.g. for use in eye and joint surgery, orthopedics, rheumatclogy or dermatclogy) comprises cultivating a Bacillus host cell and recovering the hyaluronic acid from the cultivation medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      that play a role in the synthesis of hyaluronic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 8 A; 5 C; 3 G; 4 T; 0 U; 0 Other;

The present invention describes a method of determining whether an individual is predisposed to susceptibility to low bone mineral density (BMD) and/or bone damage comprising identifying whether the individual has at least one polymorphism in a polymucleotide encoding a protein, where the polymucleotide is one of 81 200-500 nucleotide sequences (S1, see ADC98235 to ADC98135). An agent identified in an method from the present invention which can be used for the prevention or treatment of a disease resulting in susceptibility to low BMD and/or bone damage is usceptibility to low BMD and/or bone damage is susceptibility to low BMD and/or bone damage is susceptibility to low BMD and/or bone damage. The disease associated with low BMD and/or bone damage is osteoporosis. The present PCR primer sequence is used in the exemplification of the present invention.
                                                                                                                                                                    Determining whether an individual is predisposed to susceptibility to low bone mineral density (BMD) and/or bone damage, involves identifying polymorphisms in associated genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a tubercle bacillus gene chip and its application. According to the characteristics of tubercle bacillus genome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for inducing apoptosis in a cell inhibitor to reduce Jagged 2 levels or activity. Also described: 1 treating a subject having a disease or condition associated with insufficient apoptosis by administration of a Jagged 2 inhibitor; (2) a pharmaceutical composition comprising a Jagged 2 inhibitor and another active ingredient for inducing apoptosis; and (3) a kit comprising a the Jagged 2 inhibitor in the Induction of apoptosis; The Jagged 2 inhibitor in active ingredient for inducing apoptosis; and (3) a kit comprising a the Induction of apoptosis. The Jagged 2 inhibitor in activity. The method can be used for inducing apoptosis in a cell or animal for treating a subject having a disease or condition associated animal for inducing a subject having a disease or condition associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               low bone mineral density; BMD; bone damage; polymorphism; osteoporosis; single nucleotide polymorphism; SNP; PCR primer; ss; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     present sequence represents a human Jagged 2 chimeric phosphorothioate antisense oligonucleotide, which is used in an example from the present

sequence and molecular mechanism produced by tubercle bacillus resistance to drug, and according to its application the probe can be designed and selected, and the probe array can be regularly and reasonable arranged according to a certain mode to form optimized probe array. The gene chip can be used for quickly, accurately and high-efficiency identifying tubercle bacillus, and can be used for screening and detecting its resistance to drug, and can detect the mutation of specific site of tubercle bacillus gene sequence and the mutation of non-specific site. The invention can be used for tuberculosis diagnosis and reasonable selection of medicine. The present sequence represents a probe related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "Phosphorothioate backbone where all cytidines are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides for modulating Jagged 2 expression, useful for diagnosing, preventing or treating diseases or conditions associated with Jagged 2, e.g. cancer or developmental disorders.

                          The invention relates to novel antisense compounds targetted to a nucleic acid molecule encoding Jagged 2 to inhibit its expression. Antisense compounds of the invention are useful for treating an animal having a disease or condition associated with Jagged 2, e.g. hyperproliferative disorder (particularly cancer), a developmental disorder or a disease or condition that arises from aberrant apoptosis. They are also used for diagnostics, prophylaxis or as research reagents or kits. The invention is also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human Jagged 2 DNA. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides of 8-40 nucleobases, useful for modulating
the function of nucleic acid molecules encoding Jagged 2, ultimately
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Phosphorothioate antisense DNA oligo to modulate human Jagged 2 SeqID 51.

This invention relates to movel antisense compounds that can be used to modulate the expression of Jagged 2. Specifically, it refers to compositions useful for inhibiting the expression of Jagged 2, a human homologue of the Drosophila Serrate gene, which is involved in differentiation and cell fate, as well as positive feedback control over signalling genes such as Notch 1, Notch 3 and Jagged 1. The Jagged 2 gene is located on chromosome 14932, a region that has been implicated in retinitis pigmentosa. The present invention describes antisense oligonucleotides that comprise at least one modified sugar moiety, a 2'-O methoxyethyl (2' MOE) and at least one modified sugar moiety, a 2'-O methylcytosine. These compounds are useful for modulating the function of nucleic acid molecules encoding Jagged 2, ultimately modulating the reagents and in diagnostics. This oligonucleotide sequence is a smount of Jagged 2 produced, which in turn is useful for research reagents and in diagnostics. This oligonucleotide sequence is a phosphorothioate antisense DNA oligo used to modulate human Jagged 2 expression in an exemplification of the invention.
modulating the amount of Jagged 2 produced.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 14489; 872pp; English.

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypoteensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antialmanatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing benefit in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fig. at ftp.wipo.int/pub/published_pot_sequences

WPI; 2003-093058/08.

Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

```
This invention describes a nowest composition, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating cypression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery cypression of the invention has antiallergic, antiinflammatory, antiasthmatic, instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, of the invention has antiallergic, antiinflammatory, antiasthmatic, of the invention has antiallergic, antiinflammatory, antiasthmatic, of treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target polypeptide present in the lungs. The reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, with a disease or condition such as pulmonary vasoconstriction, whypertension, emphysema, chronic observations, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the targ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                 invention describes a novel composition (a) a first active agent,

                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cowsert LM,
This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating construction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition is useful for preventing or comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung cinflammation, allergies and/or bronchoconstriction and/or lung distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary chartension, emphysema, chronic obstructive pulmonary disease, pulmonary intertions brain or election, pulmonary intections, brained adenosine content of the anti-sense object the pulmonary the breakdown of the reduced adenosine content of the anti-sense to prevent the breakdown of the oligonucleotides into products that free adenosine into the preduced adenosine content of the anti-sense operonment and thereby to e.g. lung. brain, heart, kidney, etc. tissue environment and thereby to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                              Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and

The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding LIM domain kinase 1. The compound operationally hybridises with the nucleic acid molecule encoding LIM domain kinase 1 and inhibits the expression of LIM domain kinase 1. It specifically hybridises with at least an 8-nucleobase portion of a preferred trager region on the nucleic acid molecule encoding LIM domain kinase 1. The antisense oligonucleotied is useful for modulating the expression of LIM domain kinase 1 in cells or tissues to treat diseases associated with their expression, such as a developmental disorder or a neurological disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                neuroprotective, LIM domain kinase 1, developmental disorder, neurological disorder, diagnostic, prophylaxis, human, ss.

The compound specifically hybridises with the nucleic acid molecule encoding LIM domain kinase 1 and inhibits the expression of LIM domain kinase 1. It specifically hybridises with at least an 8-nucleobase portion of a preferred target region on the nucleic acid molecule encoding LIM domain kinase 1. The antisense oligonucleotide is useful for modulating the expression of LIM domain kinase 1 in cells or tissues to treat diseases associated with their expression, such as a developmental disorder or a neurological disorder. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotides for modulating LIM domain kinase 1 expression, useful for diagnosing, preventing or treating conditions associated with the kinase, e.g. neurological or developmental disorders.

The present invention relates to an oligonuclectide anti-sense to e.g., initiation codon, coding region with 2-10 nuclectides of 5'-end and 3'-end of nucleic acid target comparising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the cligonuclectide and optionally surfactant operatively linked to the oligonuclectide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of subject an effective amount of an inhibitor. The oligonuclectide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(iss), asthma, impeded chosen from airway inflammation, allergy(iss), asthma, impeded conspiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway constitution. The present sequence represents an oligonuclectide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..

New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding resistin, useful for treating a metabolic disorder,
e.g. diabetes or obesity, or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding resistin, and inhibits the expression of resistin. The composition and methods are useful for treating a disease or condition associated with resistin, as metabolic disease, e.g. diabetes or obesity, or atherosclerosis. They are also useful in research and diagnostics for modulating the expression of resistin. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding resistin, useful for treating a metabolic disorder,
e.g. diabetes or obesity, or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding resistin, and inhibits the expression of resistin. The compound, composition and methods are useful for treating a disease or condition associated with resistin, such as a metabolic disease, e.g. diabetes or obsetty, or atherosclerosis. They are also useful in research and diagnostics for modulating the expression of resistin. This sequence

                                                                                                                                                                                                                                                                      The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeninal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                   New antisense compound targeted to a nucleic acid molecule encoding about.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

New antisense compound targeted to a nucleic acid molecule encoding

```
ö
                                                                                                                          nucleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligomucleotide with 2. MOE wings and a deoxy gap. Used during the antisense inhibition of human Navi.3 expression, the oligomucleotides are designed to target different regions of the human Navi.3 RNA.
Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                  ö
associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeninal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder; including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an antisense compound targeted to a mucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate bain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to neonatal or infantile epilepsy, or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide, with luman Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound targeted to a nucleic acid molecule encoding Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

 defined sequence of, a mature form, one or more conservative cubstitutions or at least 95% identity to 158 amino acids SEQ ID NO: 2n substitutions or at least 95% identity to 158 amino acids SEQ ID NO: 2n cas given in the specification, where n is an integer between 1-33. The novel proteins of the invention are members of the following families: novel proteins of the invention are members of the following families: intracellular protein-like proteins; sorting nexin 6-like proteins; cMob5 cancer specific proteins; ERP16 protein-like proteins; cMob5 cancer specific proteins; ERP16 proteins; cMob5 cancer specific proteins; ERP16 proteins; cMob5 cancer specific proteins; ERP16 proteins; containing proteins; actin-binding proteins; actin-binding protein alpha-like proteins; actin-binding protein frabin-alpha-like proteins; actin-binding protein specific proteins; actin-binding proteins; haematopojetic contoining in the proteins; and tumour protein MDS029-like proteins; TRAP-delta-like proteins; and tumour protein MDS029-like protein; TRAP-delta-like proteins; and tumour protein p53-binding protein 130-like proteins; carrivin light chain-like proteins; leucine-rich protein; and tumour protein p53-binding protein 2-like proteins; carrivin of the Novx polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence represents a probe used in the carrivin of DNA encoding a novel human polypeptide of the invention.

```
The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mDGES-1). The human mpcRES-1 gene is located on chromosome 9, more specifically to olystopic mpcRES-1 gene is located on chromosome 9, more specifically to olystopic mpcRES-1 and sequence comprising 8-30 bp targeted to a nucleic acid encoding mpcRES-1, which specifically whybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mpcRES-1 in cells or tissues; and (3) a method of treating an animal condition associated with mpcRES-1. MPCRES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiamatory, neuroprotective, nootropic, antidiamatory, neuroprotective, nootropic, antidiamatory, usaotropic and cardiovascular activities, and can be used as mpcRES-1 inhibitors and in gene therapy. The antisense compound to be used as mpcRES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpcRES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or copithalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20 BP; 8 A; 8 C; 2 G; 2 T; 0 U; 0 Other;

The human mPGBS-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiamatory, neuroprotective, antidiamatory, neuroprotective, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disoacer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase; imPGES-1; mPGES-1 inhibitor; intidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; assotropic; ophthalmological; immunomodulatory; cardiavascular; gene therapy; inflammation; Alzheimer; disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                          The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGBS-1). The human mpGBS-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-10 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding inhibite its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal harisense condition associated with mpGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiarthitic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischemmia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase; inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder;

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mGCBS-1). The human mmcGBS-1 gene is located on chromosome 9, more specifically to ogd4.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding meDGBS-1, which specifically hybridise with the nucleic acid encoding compounds inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal carbonial adisease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, assotropic, antidiamaclosy, neuroprotective, nootropic, antidiamaclosy, neuroprotective, nootropic, antidiamaclosy, or sphthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used as wed for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alabeimer's diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g. inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to oppose 1 and 1 antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisflammatory, neuroprotective, antisflammatory neuroprotective, neuroprotective, antisflammatory ineuroprotective, antisflammatory ineuroprotective, antisflammatory ineuroprotective, antisflammatory and and in gene therapy. The antisense compound be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.; inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion inhury, or ophthalmic, immunological, cardiovascular or neurological disorder.
New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The invention relates to oligonuclectides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nuclacidese of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) crossen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) crosses a, tryptase b, pDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention and/or tractment of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the construction and/or tractment of a respiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a construction and/or tracting a respiratory or lung disease. The creptorides b, PDE4 B, PDE4 C, or PDE3, ICAM, VCAM, tryptase a, creptoratory or lung disease. The creptorides b, PDE4 B, PDE4 C, or PDE3, ICAM, VCAM, tryptase a, creptoratory or lung disease. The creptoride, and/or asthma and/or lung allergies associated with creceptor(s), chronic obstructive pulmonary disease (COPD), creceptor fibrosis (CF), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distances syndrome, pulmonary

This invention relates to the identification of a novel susceptibility locus AST-1 for asthma and other IgE mediated diseases mapped to the human chromosome 7014-p15. Specifically, it refers to two overlapping can ensure an amely GPRA (G-protein coupled receptor for asthma susceptibility) and AAA1 (asthma associated alternatively spliced gane 1). The present invention describes identifying single nucleotide polymorphisms, as well as insertion or deletion polymorphisms, occurring at different positions in the AST-1 locus, and furthermore providing vectors, host cells, primers and probes in order to determine the status of an individual. Accordingly, it provides a kit to diagnose or assess predisposition to cathma, chronic obstructive pulmonary disease or cancer and other IgE mediated disease including rhinitis and dermatitis, such that derived pharmaceutical compositions exhibit cytostatic and antiasthmatic activities. Purthermore, it provides a transgenic animal comprising the asthma locus-1 (AST-1) DNA. This obligonucleotide sequence is a PCR primer used to sequence the exon and exon/ intron boundaries of human GPRA DNA,
                                                                                                                                                                 ö

The MEKK proteins are used to modulate and regulate signal transduction in cells, as well as for regulation of gene transcription in a cell encoding MEKK, where the cell is involved in inflammation, regulation of cellular proliferation and differentiation, regulation of development, regulation of cell death or regulation of inflammation. They are also used to prepare antibodies. MEKK polynucleotides can be used to produce the protein recombinantly and as a source of probes and primers. The present sequence represents a PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes human mitogen-activated protein kinase/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human MEKK polynucleotides and polypeptides, used for regulating signal transduction in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for human MEKK2, which is used in an example from the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for inducing an immune response against B-lymphoproliferative disorders. The method comprises DNA sequences encoding for the complementarity determining region 3 (CDR3) hypervariable region of immunoglobulin heavy chain (VH-CDR3) alone or in combination with at least another immunomodulating sequence. The DNA sequences are useful as therapeutic vaccines for thronic B-lymphoproliferative disorders in mammals, preferably humans. A recombinant plasmid expression vector containing a DNA sequence of the invention is useful as a therapeutic vaccine or for the manufacture of a vaccine effective against chronic B-lymphoproliferative disorders expressing the surface idiotypic immunoglobulin on B-cells in mammals, preferably humans. An efficient, safe and easily reproducible DNA-based immune response against B-lymphoproliferative pathologies can be achieved. The present sequence represents a PCR primer used to amplify thumans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of DNA sequences coding for hypervariable region (VH- complementarity determining region 3 (CDR3)) of idiotypic immunoglobulin expressed on B-cells of chronic B- lymphoproliferative disorders, as therapeutic

The invention relates to an isolated polymucleotide comprising a sequence having 2618 bp encoding a phosphatidic acid-preferring phospholipase Al colympetide comprising a sequence having 872 amino acids or which is at least 88% identical to it; or a fragment, or a variant of the colymucleotide. The pharmaceutical composition comprising the expression vector or the reagent is useful for preparing a medicament for modulating the activity of a phosphatidic acid-preferring phospholipase Al protein in a disease such as CNS, genitourinary, cardiovascular or haematological disorder, asthma, cancer or chronic obstructive pulmonary disease. The colymucleotide of the invention can also be used in dispnostic assays for detecting diseases or abnormalities, or susceptibility to diseases related to the presence of mutations in the nucleic acid sequences that encode the enzyme. The polymucleotide of the invention can also be used in gene therapy to treat such disorders. This polymucleotide sequence represents a PCR primer of the phosphatidic acid-preferring phospholipase Al protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                           1) polynucleotide. The polynucleotide is useful in an in vitro method for identifying a single nucleotide polymorphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for disapnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug

The invention relates to a multidrug resistance-associated protein 1 (MRP of invention relates to a multidrug resistance-associated protein 1 (MRP for identifying as ingle nucleotide polymorphism and for identifying and obtaining a pro-drug or drug capable objection and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal canner) or a disease related to multidrug resistance. This sequence represents a human MRP-1 polymorphic DNA region
Novel multidrug resistance-associated protein 1 polynucleotide useful for diagnosis and treatment of cancer and multidrug resistance related diseases, and for identifying single nucleotide polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immunomodulator; cytostatic; nootropic; neuroprotective;

The present invention describes NOVX proceins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule davoe; (3) an isolated nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above colypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or abortwity of the polypeptide; (11) a method of secribed above; (12) methods of the above polypeptide or modulator of activity or of latency or predisposition to a pathology associated with the above polypeptide in a method for modulator of activity or of latency or predisposition to capathology associated with the above polypeptide in a manual, and (14) a method for producing the above polypeptide in a contenting a method for producing the above polypeptide in a contenting a method for producing the above polypeptide in a contention and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a caid molecule may be used to diagnose, treat or prevent metabolic caid molecule may be used to diagnose, treat or prevent metabolic caid molecule may be used to diagnose and present and antilipaemic activities, and can be used to present and activity of activities, and can be used in gene therapy. The call conten disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a probe for a human NOVX sequence, which is used in an example from the present invention. Example C; Page 368; 586pp; English.

Transferring sulfate to 6-0 position of N-acetylglucosamine sugar residue in a polysaccharide preparation, by contacting the preparation with glucosaminyl 6-0-sulfotransferase protein in presence of a sulfate donor.

Example 14; Page 29; 48pp; English.

The invention relates to a novel method for transferring a sulfate on to coloposition of a Nacetylglucosamine (GlcNAC) sugar residue in a polysaccharide preparation, comprising providing a polysaccharide conditions which pervised in the presence of a gluosaminyl 6-0-sulfotransferase (6-0ST) protein in the presence of a sulfate donor under conditions which permit 6-0ST protein to add a sulfate donor under conditions which permit 6-0ST protein to add a sulfate to the 6-0-position of a GlcNAC sugar residue. This method is cusful for enriching the portion of anticoagulant heparan sulfate present of and contacting the preparation with 6-0ST protein. Buriching the preparation with 6-0ST protein. Buriching the contacting the preparation with 6-0ST protein. Buriching the antithrombin-binding fraction of a heparan sulfate pool is useful in the production of anticoagulant heparan sulfate which have clinical applications as therapeutics, e.g. as an agent to treat or prevent thrombotic disease and to maintain blood flow in medical devices, e.g. dialysis machines. The 6-0-sulfated preparations and the heparan sulfate to coat surfaces of extracorporeal medical devices or intracorporeal composed improved by administration an anticoagulant, e.g. thrombotic disease and coat surfaces of extracorporeal medical devices or intracorporeal copic devices (e.g. transplants, stents or other prosthetic implants) to reduce colocating on those surfaces. The mutant CHO cell hyper-produces anticoagulant-active heparan sulfate. This polynucleotide sequence

ACC69489 to ACC69495 encode the human dual-specificity phosphatases
designated DSP-18a to DSP-19f and prototypical DSP-18pr given in ABR43450
CC cho ABR43456. DSP-18 proteins have the ability to dephosphorylate an
activated mitogen activated protein (MAP)-kinase. DSP-18 sequences have
cytostatic, immunosuppressive and antiallergic activities, and can be
cytostatic in be used for identifying antibodies and other modulators
cyparticularly inhibitors) of DSP-18 activity. The DSP-18 proteins may be
cyparticularly inhibitors of DSP-18 activity. The DSP-18 proteins are especially useful
conversally or treat diseases associated with cell proliferation of
coll, differentiation or survival. The DSP-18 substrates. A modulator of
coll, differentiation of a cell or modulating a proliferative response in a
cell, differentiation of a cell or survival of a cell; or for treating a
cell, differentiation of a cell or survival of a cell; or for treating a
cell, differentiation of a cell or survival of a cell; or for treating a
cell, differentiation of a cell or survival of a cell; or for treating a
cell, differentiation of a cell or survival of a cell; or for treating a
cell, differentiation of a cell or survival of a cell; or for treating
cell, differentiation of a cell or survival of a cell; or for treating
cell, differentiation of a cell or survival of a cell; or for treating
cell, differentiation of a cell growth, abnormal cell proliferation, or
cell cycle abnormalities) associated with DSP-18 activity. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; dual-specificity phosphatase; DSP-18; enzyme; cytostatic; immunosuppressive, antiallergic; MAP-kinase modulator; dephosphorylation; signal transduction modulator; cell prolliferation; cell differentiation; cell survival; prolliferative response; Duchenne muscular dystrophy; cancer; graft-versus-host disease; autoimmune disease; allergy; metabolic disease; abnormal cell growth; abnormal cell prolliferation; cell cycle abnormality; PCR primer; ss.

example from the present invention

```
The present invention describes an antibody expression library derived from a patient that has been immunochallenged with one or more foreign antigens associated with a particular disease or foreign agent. Also described: (1) a method for producing the expression library derived from the patient as described above; (2) libraries of cloned nucleic acid fragments comprising the variable heavy chain regions and/or variable cight fragments comprising the variable heavy chain regions and/or variable cight fragments, of antibody spense derived from the antibody-producing cells of immunochallenged patients; (3) a method or isolating from an antibody expression library one or more antibody molecules that is a specific binding patrent for a carget antigen; (4) a method of manufacturing a specific antibody comparison of target antibody molecule identified, manufactured or formulated as above; (6) an enthod of traating, diagnosing or imaging a patient; (7) a method to develop and/or produce a recombinant vaccine; (8) a comprising one or more dummy nucleic acid fragments located in the parts of the vector into which the nucleic acid inserts encoding a desired of that they are not in reading frame with the other parts of the expression to polypeptide will be cloned, where the dummy fragments are positioned such that they are not in reading frame with the other parts of the expression conducts. The antibody expression library has cytostatic, immunosuppressive and antiallergic activities, and can be used in gene products. The antibody expression florary and can be used in gene conducts. The antibody expression florary with different target antigens to identify cross-reactive antibodies, for developing vaccines and identifying the immunosens of a vaccine that stimulate the most
                                                                                                                                                                                                                                                                                                                     antibody expression library; antibody; vaccine; cytostatic; immunosuppressive; antiallergic; gene therapy; cancer; autoimmune disease; allergic disease; target antigen; PCR primer; V-gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antibody expression library derived from a patient that has been immunochallenged with one or more foreign antigens, useful for treating cancer, or autoimmune and allergic disease.
                                                                                                                                                                                                                                                                               V-gene primary amplification PCR primer N5.

        identifying, selecting or manufacturing one or more antibody molecules that bind specifically to one or more target antigens. The expression vector is useful for producing an antibody expression library. The present sequence represents a PCR primar for the primary amplification V-gene, which is used in an example from the present invention for the generation and screening of meningococcal B vaccine libraries.

This invention relates to novel compositions that comprise short interfering RNA (siRNA) molecules, which can be used to inhibit amagiogenesis. Specifically, it refers to siRNAs that target and cause RNAi-induced degradation of mRNA from human vascular endothelial growth factor (VEGF), the VEGF receptor (FIt-1) and the FIk-1/KDR (kinase domain region) genes, as well as mutants derived thereof. The present invention bind to the target mRNA, such that expression is inhibited and the target degraded. As such, siRNA administered in combination with a therapeutic agent is useful for treating diseases associated with angiogenesis and the overexpression of VEGF, which include diabetic retinopathy, agerelated macular degeneration, inflammatory disease, psortasis and rheumatoid arthritis. Furthermore, it can be used to treat various

This invention relates to novel compositions that comprise short interfering RNA (siRNA) molecules, which can be used to inhibit angiogenesis. Specifically, it refers to siRNAs that target and cause RNAsi-induced degradation of mRNA from human vascular endothelial growth factor (VEGP), the VEGF receptor (Flt-1) and the Flk-1/KDR (kinase domain describes sense and antisense RNA strands thereof. The present invention bind to the target mRNA, such that expression is inhibited and the target degraded. As such, siRNA administered in combination with a therapeutic agent is useful for treating diseases associated with angiogenesis and the overexpression of VEGF, which include diabetic retinopathy, agerrelated macular degeneration, inflammatory disease, psoriasis and

Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic

Accordingly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antinflammatory, antipsoriatic, antirheumatic and antiarthritic activities. This oligonuclectide is a human Flk-1/KDR DNA oligo, a target for siRNA inhibition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        infectious disease; anorexia; cancer; cancer-associated cachexia; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia; metabolic syndrome X; wasting disorder; probe.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to novel compositions that comprise short interfering RNA (sirRA) molecules, which can be used to inhibit angiogenesis. Specifically, it refers to sirNAs that target and cause RNAsi-induced degradation of mRNA from human vascular endothelial growth factor (VBGP), the VBGP receptor (File-1) and the File-1/KDR (Kinase domain region) genes, as well as mutants derived thereof. The present invention describes sense and antisense RNA strands that form an RNA duplex and bind to the target mRNA, such that expression is inhibited and the target of degraded. As such, siRNA administered in combination with a therapeutic agent is useful for treating diseases associated with angiogenesis and the overexpression of VBGP, which include diabetic retinopathy, agerelated macular degeneration, inflammantory disease, psoriasis and rehematorid arthritis. Furthermore, it can be used to treat various cancers including breast, retinoblastoma, Wilm's tumour and lymphoma.
                                                                                                                                                                                                                        ö
cancers including breast, retinoblastoma, Wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, antidiabetic, ophthalmological, antinflammatory, antipsoriatic, antirheumatic and antiarthritic activities. This oligonuclectide is a human Flk-1/KDR DNA oligo, a target for siRNA inhibition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human; 88; short interfering RNA; siRNA; angiogenesis; vascular endothelial growth factor; VEGF, VEGF receptor; Flt-1; Flk-1/KDR; kinase domain region; diabetic retinopathy; age-related macular degeneration; inflammatory disease; psoriasis; rapenmatoid arthritis; cancer; breast; retinoblastoma; Wilm's tumour; lymphoma; cytostatic; antidiabetic; ophthalmological; antiinflammatory; antipsoriatic; antiarthritic.

MILLET I. PEYMAN J A. SMITHSON G.

(MILL/) (/LIWS

represents a human NOVX probe.

```
The invention relates to isolated NoVX polypeptides and polymucleotides.

NoVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NoVX polypeptides. For example, NoVX polypeptides and activity of NoVX by supplementing the patient our polymucleotides may be used to treat disorders associated with decreased compression or activity of NoVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NoVX polypeptides by blodymucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NoVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators anti-NoVX polypeptides and antagonists of the expression and activity of NoVX. The anti-NoVX polypeptides and antagonists and antagonists and antagonists of the expression and activity of NoVX canti-NoVX polypeptides antibodies and antagonists may also be used as diagnostic agents for detecting the presence of NoVX in samples. NoVX colypeptides and polymucleotide expression and activity of NoVX colypeptides and polymucleotide may be used in this way to prevent. Colisease, ancrexia, cancer associated cachexia, metabolic disorders, harbaimer's Disease, Parkinson's Disorders, and the various dyslipidaemias, metabolic disorders, has matabolic syndrome X and colisturbances associated with obesity, the metabolic syndrome X and washing disorders associated with obesity, the metabolic syndrome X and washing disorders associated with obesity, the metabolic syndrome X and washing disorders associated with obesity, the metabolic syndrome X and washing disorders associated with obesity, the metabolic syndrome X and context.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X, Patturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Ort T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E, Jui W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; Shimkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo Eisen A, Gangolli EA, Rieger DK, Spaderna SK;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 54; SEQ ID NO 265; 395pp; English.
                                                                                                                                                                                                                                                                                                                            STONE D J.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated, mutant murine or human phospholipase C (PLC) gamma-2 protein. The mutant PLCgamma-2 proteins and nucleic acids that encode them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate PLCgamma-2 expression. For example, the peptides and nucleic acids may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of PLCgamma-2 by expressing inactive proteins or to supplement the patients administered to down regulate PLCgamma-2. Conversely inhibitory nucleic acids may be administered to down regulate PLCgamma-2 expression. The PLCgamma-2 proteins and nucleic acids may also be used in assays to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              modulators of PLCgamma-2 expression and activity. The antibodies and antagonists may also be used to down regulate expression and activity. Disorders that may be prevented, diagnosed and/or treated by the above methods include, e.g. Wegener's granulomatosis, Churg-Strauss syndrome or Polyarteritis nodosa. This sequence corresponds to a PCR primer to amplify the mouse phospholipase C gamma 2 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mutant murine or human Phospholipase C (PLC) gamma-2 proteins, useful for preventing, diagnosing and treating inflammatory diseases, e.g. Wegener's granulomatosis, Churg-Strauss syndrome or Polyarteritis nodosa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ss; primer; anti-inflammatory; dermatological; osteopathic; ophthalmological; antiulcer; murine; human; phospholipase C gamma-2 protein; diagnosis; Wegener's granulomatosis; Churg-Strauss syndrome; Polyarteritis nodosa.

Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such as class 1/2 HLA comprises identifying all possible nucleotide sequences of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
                                                                       DNA sequence analysis, sequencing, protein sequence, protein structurgene typing, organ donation, bacteria identification, 16s rRNA, HLA, human leukocyte antigen, PCR primer, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 25 BP; 2 A; 4 C; 1 G; 18 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an immunoglobulin molecule comprising of one or more heavy chain framework regions comprising HFR1, HFR2, HFR3 or HFR4 and one or more light chain framework regions comprising LFR1, LFR2, LFR3 or LFR4, and complementarity determining regions (CDRs) comprising CDR-H1, CDR-H2, CDR-H3 and/or CDRL1, CDR-L2 or CDR-L3. The immunoglobulin is useful in therapeutic or diagnostic assays comprising ELISA, phage display, tumour imaging or protein chips assay. Further, the immunoglobulin is useful in screening assays for detecting molecules that bind to the immunoglobulin molecule. The present sequence represents a primer of the invention.

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant trumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Boola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Triplex formation; DNA detection; triple helix; identification; bacteria;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          triple helix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methylcytosine for increased triplex stability. The present sequence is used in the assay of the invention, where it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded DNA test sequences to an aqueous medium containing at least one complex of anchor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a polynucleotide that is able to form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Triple helix third strand of n-myc gene nucleotides 4791-4725.

                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                            The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used to type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
                                                                                                   Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such as class 1/2 HIA comprises identifying all possible nucleotide sequences of

RNA template, C(UA)3G used to direct RNA synthesis by HCV RNA polymerase.
DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of

The present invention relates to an assay system for hepatitis C virus (HCV) replicase activity. The assay system comprises an RNA template that has an unstable, small stemloop at the 3' end capable of forming a copyback structure, a HCV non-structural protein 5B (NSSB), ATP, GTP, CTP, and UTP nucleoside triphosphates (NTPS), where one of the NTP is and UTP nucleoside triphosphates (NTPS), where one of the NTP is and UTP nucleoside triphosphates to the identification of optimal compounds or replacements of an RNA template for copy-back self-priming RNA synthesis of HCV. This activity can be used to screen for anti-HCV replicase compounds correctise the biological relevance of lead compounds. The Correctise the biological relevance of lead compounds The COPT NASSB polymerase mechanistically and kinetically and for designing small RNA templates can be used for developing a system to characterise the co-crystatalise with HCV NSSB polymerase. The assay system of the invention is useful for detected by evaluating an sutoradiograph of reaction products separated by Gel electrophoresis. The present sequence is RNA template, CC(AU) 2GG used to direct RNA synthesis cused in the exemplification of the invention
                                                                                                                                                                                                            Assay system for hepatitis C virus replicase activity comprises RNA template with unstable, small stemloop capable of forming copy-back structure, viral non-structural protein 5B, nucleoside triphosphates,

The present invention relates to an assay system for hepatitis C virus (HCV) replicase activity. The assay system comprises an RNA template that has an unstable, small stemhloop at the 3' end capable of forming a copy-back structure, a HCV non-structural protein 5B (NSSB), AFP, GTP, TP, and UTP nucleoside triphosphates (NTPS), where one of the NTP is radiolabelled and an assay buffer that supports replication activity of NSSB. The invention also relates to the identification of optimal properties of an RNA template for copy-back self-priming RNA synthesis of HCV. This activity can be used to screen for anti-HCV replicase compounds or to characterise the biological relevance of lead compounds. The optimal RNA templates can be used for developing a system to characterise HCV NSSB polymerase mechanistically and kinetically and for designing system of the invention is useful for detecting HCV replicase activity. The nucleic acid synthesised by NSSB is detected by evaluating an

The present invention relates to an assay system for hepatitis C virus (HCV) replicase activity. The assay system comprises an RNA template that has an unstable, small stemhoop at the 3' end capable of forming a copyback structure, a HCV non-structural protein 58 (NSSB), ATP, GTP, TP, and UTP nucleoside triphosphates (NTPS), where one of the NTP is cradiclabelled and an assay buffer that supports replication activity of NSSB. The invention also relates to the identification of optimal properties of an RNA template for copy-back self-priming RNA synthesis of HCV. This activity can be used to screen for anti-HCV replicase compounds or to characterise the biological relevance of lead compounds. The optimal RNA templates can be used for developing a system to characterise (C small NA menlecules to co-crystallise with HCV NSSB polymerase mechanistically and kinetically and for designing system of the invention is useful for detecting HCV replicase activity. The nucleic acid synthesised by NSSB is detected by evaluating an incompleted.
                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     autoradiograph of reaction products separated by gel electrophoresis. The present sequence is RNA template, (AU)2 used to direct RNA synthesis by RNA polymerase proteins of HCV, BVDV and polivirus. This sequence is used

(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Gones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers Ap4F65708-T66647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf111 which contains the repeat sequence is from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer directed primer, comprising of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a SSR primer, which is flanked at its 5'-end by degenerate nucleotides. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           repeats, especially for use in e.g paternity or maternity teeting, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-76647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has the marker clone Mdf112 which contains the repeat sequence having the formula: CCACCCCCAG(CR)24.5. (Updated on 25-MAR-2003 to correct PP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection of polymorphic genetic markers of the form (dG-dA)n(dG-dT)n - veing novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                  Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sednences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
acid molecule encoding human Survivin, where the antisense coligonuclectide inhibits the expression of human Survivin. These coligonuclectides are used in the treatment of an animal suffering from a disease or condition associated with Survivin, e.g. a hyperproliferative condition such as cancer, and comprises administering a therapeuticially or prophylactically effective amount of the antisense oligonuclectides can also be used to treat a human suffering from a cligonuclectide so that expression of Survivin is inhibited. The coligonuclectides can also be used to treat a human suffering from a disease or condition characterised by a reduction in apoptosis comprising administering the antisense oligonuclectide to a human. In addition, the antisense oligonuclectide and a cytotoxic chemotherapeutic agent e.g. taxol or cisplatin, can be used to modulate apoptosis, cytokinesis or the cell cycle, or inhibit the proliferation in a cancer cell by contacting the cell with the antisense oligonuclectide. AAS21151-AAS21768 represent Survivin nucleic acids, and antisense oligonuclectides targeted to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAQ28303 and AAQ28309-13 are PCR primers which were used to amplify and isolate the Entomopoxvirus Amsacta moorei (AmEDV) spheroidin DNA sequence and associated regulatory regions. The isolated sequence contained six open reading frames encoding the spheroidin protein itself and also other structural or regulatory genes associated with spheroidin. BPV spheroidin has no significant amino acid homology to any previoualy reported protein. It is a non-essential protein which makes it desirable as a site for the insertion of exogenous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New viral vectors and chimeric vaccines - comprise entomopoxvirus expression system contg. spheroidin or thymidine kinase sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Entomopoxvirus; non-essential; regulatory sequences; vector; PCR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                     Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSN), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a SSR primer, which is flanked at its 5-end by degenerate nucleotides. The method represents modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and
                                                                                                                                                                                                  Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antisense compounds for modulating the expression of Survivin and treatment of cancer.

Tyrosine kinase, receptor, proto-oncogene, trk, detection, diagnosis, antibody, treatment, tumour, antisense, ss.

Synthetic.

Primer for amplifying tyrosine kinase receptor coding sequence.

                                                                       ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                ö
                      fragments of the surrounding DNA can be used as regulatory sequences if placed in operative association with foreign DNA. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The rpsL gene of M.leprae encodes the S12 protein of the small ribosomal subunit that is responsible for resistance to streptomycin. Two primers were designed based on this sequence and were used in a PCR amplification of M.tuberculosis DNA. Sequence analysis of the 306pp amplified fragment showed 28 differences between the rpsL gene from M.leprae (AAQ51533) and M.tuberculosis (AAQ61454). In streptomycin resistant strains, a single amino acid substitution due to a mutation in codon 43 (wild-type AAG mutated to AGG) was identified, substitution of Lys42 by Arg results in resistance to streptomycin.                                                                                                                                                                                                                                                                                                                                                                                                                                                  Three primers (AAQ64159-Q64161) were used to amplify regions of the protein tyrosine kinase receptor. The gene encoding the receptor is related to the trk proto-oncogene. Antibodies against the encoded polypeptide are useful for diagnosis and for the treament of tumours. The antibodies may also be radiclabelled or coupled to a cytotoxin for destruction of cancer cells. Antisense nucleic acid can be used to inhibit gene expression. (Updated on 25-MAR-2003 to correct PN field.)

New entomopoxvirus polynucleotide sequences, proteins and vectors - are used for expression of heterologous proteins in both insect and mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RNA from human embryonic tissue was isolated. With the use of primer P6(4) PTK-specific cDNA was synthesised. The cDNA was amplified using primers P6(4) and NS. A 2097 bp DNA fragment was obtained. Primers E3, P12 and E6 were then used in the isolation of the C-terminal of the HEKZ receptor gene. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human embryonal kinase, HEK; protein tyrosine kinase, PTK; tumour;

                                                                                                                                                                                                                                                                                                                                                                                                                                          Amplification of nucleic acid from a blood sample by enzymatic amplification is new. No prepn. of the blood sample otherwise necessary to prepurify the nucleic acid sequences to be amplified is performed and the proportion of the sample in the reaction mixt. is greater than 5 vol. if a specific amt. of salt is present in the reaction mixt. The new process was exemplified using HLA DQ, Factor IX, Hepatitis B and Rubella DNA and primers: (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                opt.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This antisense primer is derived from exon-5 of the human retinal rod CGMP-phosphodiesterase beta-subunit (PDE-beta) gene, and may be used for PCR amplification and sequencing of normal and mutant forms of the PDE-beta gene. The primer may be used along with sense primer AAT17129 or AAT17135 to detect a variant with a C-to-T transition at position 11638 are xon-5, resulting in a nonsense mutation (GHD298X) (e.g. in patients AR77 and AAI20) linked with autosomal recessive retinitis pigmentosa. Mutations in the rhodopsin and retinal degradation slow protein genes are also implicated in retinitis pigmentosa. Detection of any of these mutations in a foetus or patient may be used in diagnosis. (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Diagnosis of hereditary retinal degenerative diseases e.g. retinitis pigmentosa, - caused by a human photoreceptor protein mutation, by detection of the mutation by PCR amplification or hybridisation methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                        PCR primers HF2 (AAT27014) and HR1 (AAT27015) were designed to amplify a 700 bp fragment of the kappa fatty acid hydroxylase fally gene of castor. PCR amplification was used to detect the fall2 sequence in Arabidopsis plants transformed, by Agrobacterium tumefaciens-mediated transformation, with the fall2 gene on binary Ti plasmid pBG. Transgenic plants were identified that showed altered levels of hydroxylated fatty acids, e.g.

                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                              The present sequence is a degenerate PCR primer for protein kinase (PK) cDNA isolation. The PK may be used to treat disorders related to abnormal PK activity, and cancer. Human foetal liver polyA+ RNA was PCR amplified, and the products subcloned, sequenced and used to produce the plasmids pLKB1-1 and pLKB1-2. When the coding region of pLKB1-1 was isolated by restriction digest, and analysed by northern blotting against polyA+ RNA prepared from various human organs and cultured cells, weak expression was detected in almost all tissue and cell types. The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primers HR1 (AAT95010) and HF2 (AAT95009) were designed to amplify a 700 bp fragment of the castor kappa hydroxylase fahl2 gene. They were used to verify the presence of an intact fahl2 gene in young leaves of Arabidopsis thaliana plants that had been transformed, via Agrobacterium-mediated transformation, with the castor fahl2 gene on binary Ti plasmid plass. Transgenic Arabidopsis plants produced richnoleic acid, leaquerolic acid, densipolic acid and auricolic acid. The invention relates to the production of hydroxylated fatty acids by genetically modified plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Kappa hydroxylase, fatty acid hydroxylase, fah12 gene,
